ORSIM® Bronchoscopy Simulator

The ORSIM is an innovative simulator for teaching advanced bronchoscopy skills in a virtual environment. Specializing in difficult airways, the ORSIM lets airway practitioners prepare for real life.

Realism

ORSIM scenarios are anatomically accurate, with exceptional graphics and animation. Users can experience patients with a vocal cord cyst, angioneurotic edema, a penetrating neck injury and many more, all within an hour.

Managing the ORSIM difficult airways with the replica bronchoscope promotes psychomotor skills.
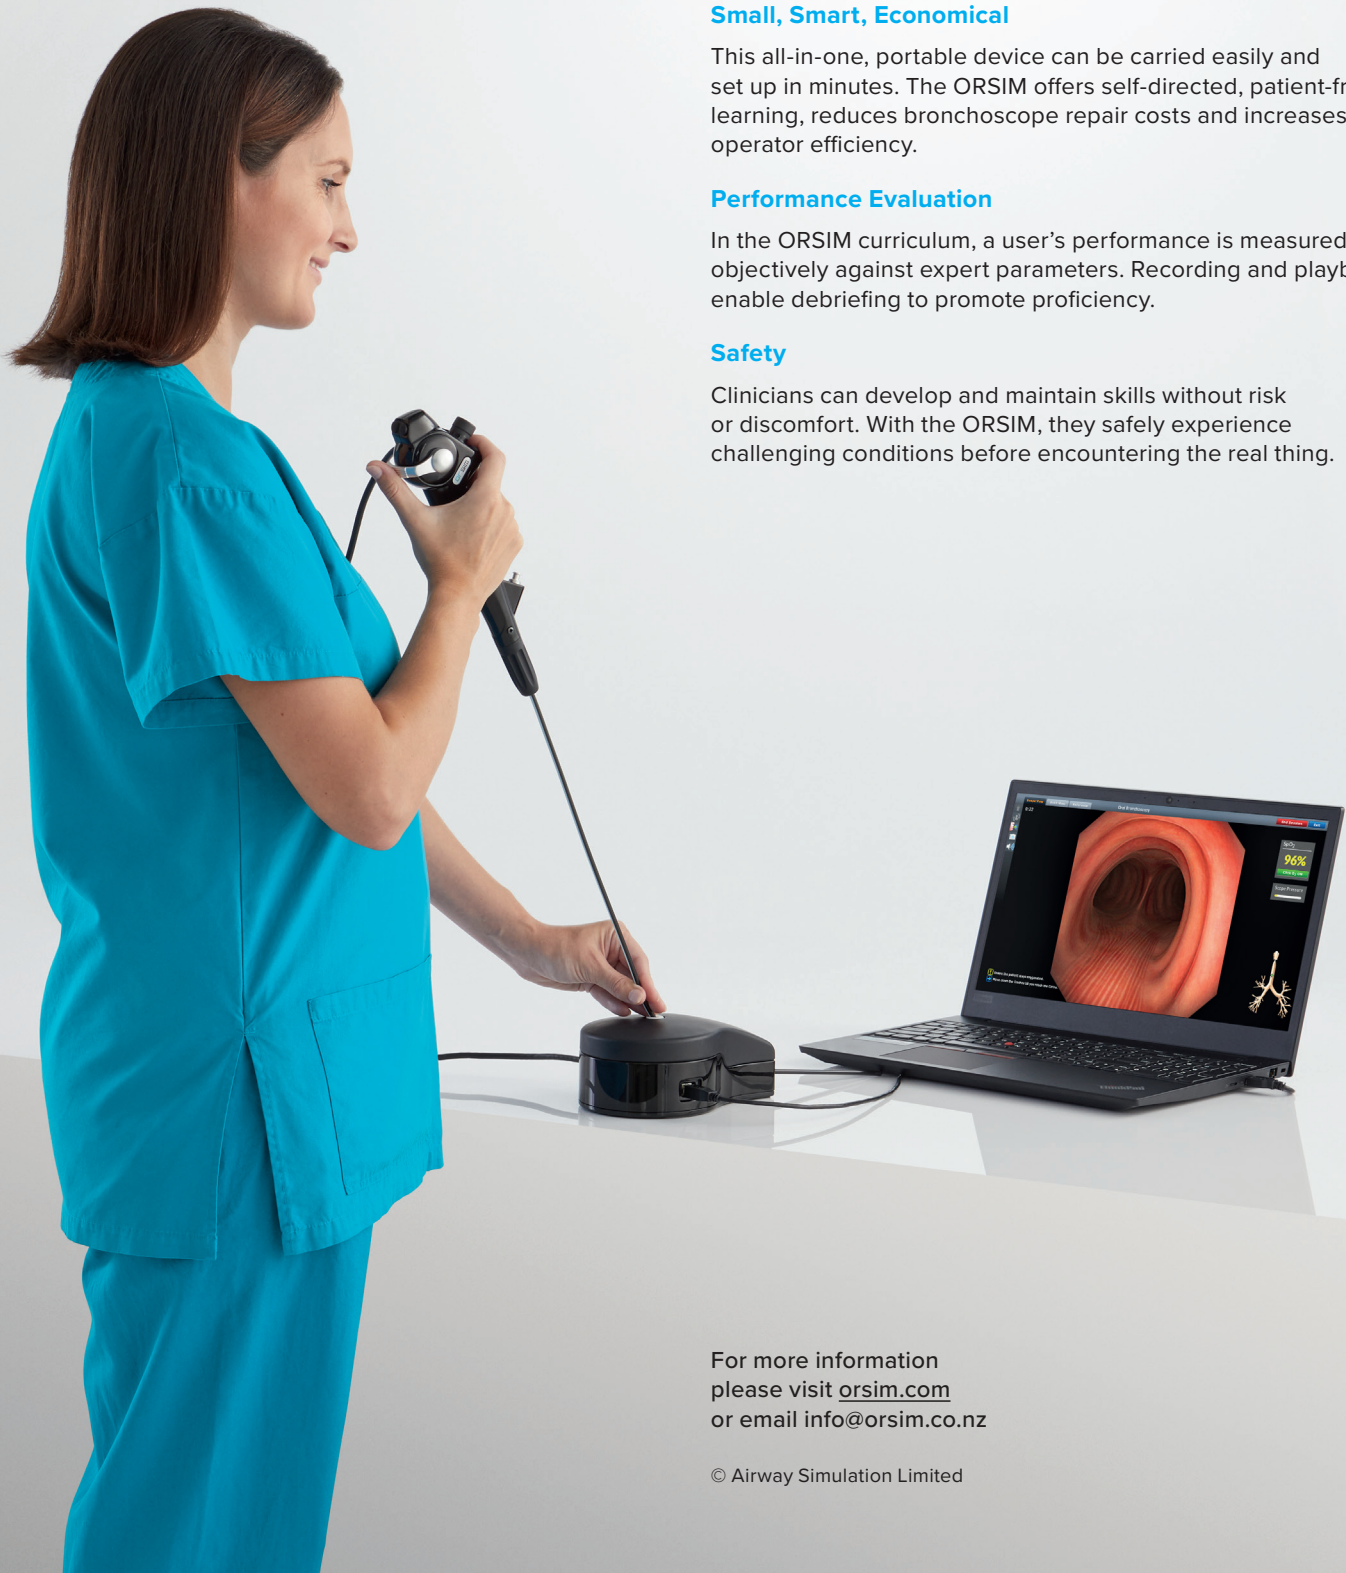

Small, Smart, Economical

This all-in-one, portable device can be carried easily and set up in minutes. The ORSIM offers self-directed, patient-free learning, reduces bronchoscope repair costs and increases operator efficiency.

Performance Evaluation

In the ORSIM curriculum, a user's performance is measured objectively against expert parameters. Recording and playback enable debriefing to promote proficiency.

Safety

Clinicians can develop and maintain skills without risk or discomfort. With the ORSIM, they safely experience challenging conditions before encountering the real thing.
